

Sortierfix

For potatoes and round-shaped tubers

- Compact sorting machine for two groups
- Gentle sorting
- Suitable for soiled and clean produce

Sortierfix

Sortierfix is an inexpensive compact sorter for two groups. Sortierfix is rather suitable for operation with not very precise sorting requirements. The products to be sorted are placed onto food-safe polyurethane belts which run parallel to each other at a defined distance. The space between the belts is the sorting gap. It is defined by the distance of rollers and can be changed only by replacing them. Grading through a square mesh is not possible. The deviation in sorting results affects the oblong products.

The machine has an inflow funnel and adjustable side containers. The height of supports can be adjusted. Sortierfix has two octagonal vibration drums for quality improvement. The standard version of these drums is made of coated steel.

Connecting several machines in series allows sorting in different groups.

Sortierfix is available only in one size with a throughput of 20 t/h. Any sorting gap from 28 to 65 mm is possible.

The useful sorting width is 800 – 1000 mm
Drive: 1.5 kW

Accessories and special versions

- Outlet conveyor
- Version made of stainless steel
